**Year: 2025**

The  $\text{QG}^{+1}$  model incorporates the first-order corrections that were neglected in the basic QG approximation. It essentially refines the QG equations by accounting for non-geostrophic (ageostrophic) flow components that are dependent on the Rossby number ( $\epsilon$ ).

In **Chapter 2**, the  $\text{QG}^{+1}$  model is introduced. In this paper,

$$N = f \equiv \text{Constant}^1$$

<sup>1</sup>page 8

To facilitate the asymptotic approximation, a potential field is introduced.

$$\mathbf{A} = (-G, -F, \Phi)$$

By Incompressible condition we have

$$\mathbf{v} = \nabla_3 \times \mathbf{A}^2$$

<sup>2</sup>In this paper  $\nabla_3$  is 3D gradient. 2D is just  $\nabla$

Some Physical implications of the model

1. Breaking Symmetry of QG model.
2. It Captures Cyclogeostrophic balance.

Cyclogeostrophic balance is a fundamental force balance approximation used in meteorology and physical oceanography to describe the motion of fluids (like air and water) in curved paths, where the Coriolis force is balanced by the pressure gradient force and the centrifugal force. It is an essential extension of the simpler geostrophic balance, which only considers straight flow. This balance is particularly important in systems with high curvature and strong winds, such as tropical cyclones (hurricanes/typhoons), mid-latitude low-pressure systems, and strong ocean eddies. The Governing Equation is

$$\underbrace{fv}_{\text{Coriolis Force}} + \underbrace{\frac{|\mathbf{v}|^2}{R}}_{\text{Centrifugal Force}} = -\underbrace{\frac{1}{\rho} \frac{\partial p}{\partial n}}_{\text{Pressure Gradient Force}} \quad (1.1)$$

Here  $n$  is the normal direction pointing toward the center of curvature.

3. Inclusiong of **Frontogenesis** <sup>3</sup>.

<sup>3</sup>Generation of Ocean Fronts

In **Chapter 3**. A simulation for  $\text{QG}^{+1}$  is conducted, showing several features:

1. More Vigorous due to captureing ageostrophic frontogenesis.
2. Since the Ageostrophic effects creates stronger surface velocity. Finer structure can be seen on surface using  $\text{QG}^{+1}$ . <sup>4</sup>.

<sup>4</sup>See Figure 4 in page 24

In summary, this paper provides a very detailed derivation to the  $\text{QG}^{+1}$  equation which is introduced more detailed in **??**. This paper also demonstrate two simulation to show how  $\text{QG}^{+1}$  model captures balanced submesoscale dynamics and frontogenesis.

SUBSECTION 1.2

### J.Wang et.al. Reconstructing the Ocean's Interior from Surface Data

**Year : 2013**

In the **Introduction**, the author discussed the current challenge of using SSH and SST<sup>5</sup> measurement to reconstruct subsurface dynamics.

<sup>5</sup>*Surface Sea Height and Surface Sea Temperature*

- Traditional studies assume the signal is dominated by barotropic and first baroclinic modes. However, these modes are typically calculated by **assuming buoyancy anomalies vanish at the surface**.
- SQG theory works as well. But it normally assume 0 interior PV.

The author introduced the **Interior plus surface QG** method. It is quasigeostrophic
